UNE PRÉSENCE MONDIALE A GLOBAL PRESENCE

Dewatering Anaerobically Co-digested Biosolids;

Learning from Experience in Scandinavian Countries

Fournier Industries

- Fabrication of heavy-duty equipment since 1960
 - Sectors
 - Biosolids Dewatering
 - Biomass Furnaces
 - Mining Equipement
 - Aluminum Smelters +

Large Hydro

Rotary Press

- 1985 Concept
- 1992 1st WWTP installation
- 2002 1st installation USA
- 2022+ 500 installations, 20

countries, 5 continents (2021)

- Water + Wastewater Sludges
- Paper Mills + Industrial
- Ethanol Production (ICM)
- Digestate from NRG Plants

Principle of

0.0.0

20.00

- Low Feed Pressure
- Slow Rotation
- 1st Zone: Thickening
- 2nd Zone: Dewatering
- Self-Cleaning Screens (Limited

Washwater)

Controlled Outlet Pressure

<u>Odors</u>

- High solids centrifuges shear anaerobically digested biosolids. (Murthy et al. 2006)
 - Increased labile proteins, an odor precursor.
 - Inhibition of methanogens that allow degradation of organosulfur compounds
- Comparative trial, rotary press-centrifuge ~2200 rpm conducted for WERF study.
 - Lower VOSC emissions from rotary press than from centrifuge (WERF 2008; Erdal et al. 2008)

Sudden Growth & Regrowth

 Following centrifugal dewatering, indicators rise above the Class A concentrations (Higgins et Murthy, 2015, Chap. 5).

Filtrate Quality

Critical for « Fertigation »

<u>Struvite</u>

- Complications linked to nutrient-rich feedstock: clogging
- Precipitate Struvite BEFORE Dewatering: Added-Value Product (Ex.: EkoBalans)

<u>Cake Dryness</u>

- Variable Dryness fonction of:
 - Feedstock (ex.: FOG vs Municipal SSO)
 - Mode de valorisation (ex.: Land Application vs Drying)

Thermal Hydrolysis Commonly Used (ex.: Cambi SA)

Digestate Transformed to Creative/Innovative Added-Value Products (ex.: Bio-Tak Grass Roofs). <u>Organized R&D Efforts</u>

Feedstocks? Everything that generates Biogas!...

........

<u>Conclusions</u>

000 00

- Digestate dewatering is critical to the technical/financial success of transformation from Waste to Resource.
- The operating characteristics of the Rotary Press have met the challenges:
- Odor prevention and bacterial regrowth
- Dryness and Filtrate Quality
- Operation and Maintenance costs

The Rotary Press technology developed by Fournier Industries contributes to meet several challenges experienced in Waster Resource Recovery Facilities. By sharing our expertise acquired in North America and Scandinavia, we wish to contribute to the success of this transformation, for a more circular and low carbon economy.
